

EMC Documentum Process Builder

Rapidly configure composite application flows, integrations, and logic

The Big Picture

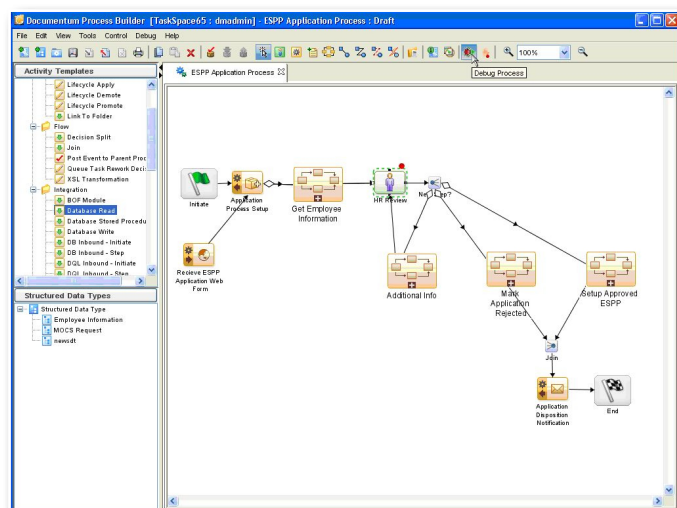

- Ability to rapidly design and implement business processes without programming ensures maximum return on your investment in business technology
- Easy-to-use graphical tools let non-programmers build and configure workflows
- Predefined activity templates for process activities enable integration with external systems, third-party applications, and data sources
- Process Debugger boosts development productivity by enabling process execution and debugging in the design environment
- Inline sub-processes help simplify and communicate the business meaning of a process
- Process Builder leverages the EMC Documentum platform for a rich set of services, such as versioning, check-in/check-out, indexing, search, renditions, and notification

EMC[®] Documentum[®] Process Builder is a powerful and intuitive design tool that minimizes time to deployment and lowers total cost of ownership by enabling non-programmers to compose and configure process workflows. Process Builder provides a modeling environment with predefined and customizable templates for defining process activities for execution by the Process Engine.

The Process Builder includes a complete set of capabilities that allow the designer to easily configure process activities such as simple manual tasks, high-volume work queues, automated content management actions, and sophisticated system integration logic through easy-to-use visual design techniques. In addition, Process Builder supports the defining of process rules, priorities, and exception handling. Deployment of standard activity templates enables enterprises to maximize both productivity and standardization through reuse across multiple applications. Process Builder allows you to expose your process data for display in dashboards and reports, giving executive insight into your processes. Graphical debugging functions enable designers to interactively test and validate logic, enhancing their ability to rapidly configure sophisticated application logic.

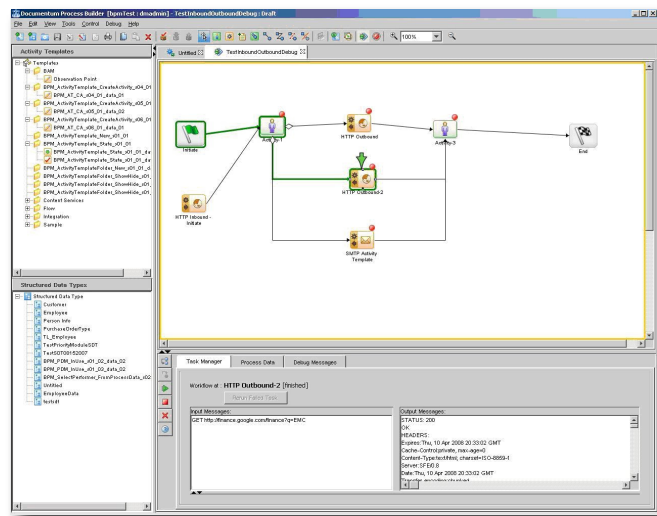

Equally well-suited for creating loosely structured collaborative processes and highly structured, high-volume transactional processes, Documentum Process Builder delivers the following capabilities:

- **Graphical design:** Process Builder is an excellent design tool that enables both IT and business resources to model their business process quickly, collaboratively, and efficiently. The tool provides nearly effortless process modeling with drag-and-drop of activities selected from a rich palette for the rapid configuration and deployment of executable workflow diagrams for business processes.

EMC Documentum Process Builder

- **Activity templates:** Process Builder includes a wealth of predefined activity templates that reduce manual work and redundant activities. These out-of-the-box activity templates support the most common features such as automated database read and write, FTP, SMTP (e-mail), dynamic web services, and outbound faxing. For case-based applications, there is a specific activity template for creating case folders. Each activity template provides a wizard that allows designers to map between process data to the parameters of the integration activity, via a graphical data mapping tool. The wizard also allows for the creation of business rules, triggers, timers, and performer selections.
- **Interactive debugging:** The Process Debugger cuts development and deployment time by as much as 50 percent by making it much easier and quicker to refine and troubleshoot process designs. The Process Debugger enables developers to design and test their processes from one design tool, dynamically checking process logic and system integrations. Simply put, it debugs the processes as they are designed.

Process Debugger

- **Inline sub-processes:** Creating sub-processes improves your ability to communicate the business meaning of a process template. A large, complicated process can become difficult to organize visually when there are many activities required to complete the entire workflow. Grouping related activities into sub-processes that collectively represent a business process results in a simpler, easier-to-understand diagram.
- **Integrated Forms Builder:** Used in conjunction with EMC Documentum Forms Builder, you can associate user interfaces with your business processes. Data collected in online forms and software can then be incorporated directly into the business process. Forms Builder provides the flexibility of multi-channel delivery—through online forms, web applications, and high-fidelity forms. Use it with both EMC Documentum TaskSpace and EMC Documentum Webtop to reduce costly paper handling and to enforce compliance policies.

About EMC

EMC Corporation (NYSE: EMC) is the world's leading developer and provider of information infrastructure technology and solutions that enable organizations of all sizes to transform the way they compete and create value from their information. Information about EMC's products and services can be found at www.EMC.com.
