

EMC SourceOne for Microsoft Exchange Server 2010

Information governance and eDiscovery for your Microsoft[®] Exchange e-mail

The Big Picture:

- Assert good information governance over e-mail and instant messages
- Reduce eDiscovery costs and ensure litigation readiness by making e-mail and other content readily discoverable
- Achieve cost savings and promote compliance across your organization's information assets with the ability to archive multiple content types
- Bring previously unmanaged PST files under control
- Ensure a smooth migration to Exchange 2010 and meet compliance requirements without burdening production systems with infrequently accessed e-mails that just take up space

Together, EMC and Microsoft offer a powerful lineup of products and solutions for integrated content archiving, corporate information governance, eDiscovery, and litigation support across content types.

Microsoft[®] Exchange Server 2010 offers customers integrated e-mail archiving, retention, and discovery capabilities that can help simplify and automate the process of protecting business communications. The new Personal Archive enables e-mail data stored in PST files to be easily moved from the desktop back to the server and accessed using Outlook and Outlook Web App. New retention management policies, including a legal hold, allows customers to preserve messages stored in Exchange, and later use the new web-based, multi-mailbox search to make it easy to find messages relevant to discovery actions.

EMC SourceOne[™] extends the archiving, retention, and discovery features of Microsoft Exchange 2010. Customers can leverage automated message capture, single-instancing, and tiered storage to reduce the costs of managing large volumes of information. Retention and disposition policies are enforced across the organization, freeing end users from the burden of meeting compliance requirements. And, because it is designed to support a variety of content types including instant messages, SharePoint, and file systems, EMC SourceOne is an ideal business archive that delivers cost savings, readiness, and promotes compliance.

Managing e-mail is a complex problem for administrators. It's a mission-critical application that grows in size and complexity every day. With that growth come more demands from your enterprise and elsewhere. You must meet regulatory, compliance, and privacy requirements, as well as support eDiscovery—frequently on very short notice. Adding to the complexity is the ongoing demand to do more with less, increase staff productivity, and also stay within your increasingly tight budget.

Message flow from Exchange 2010 to the EMC SourceOne business archive

EMC SourceOne eDiscovery – Kazeon automates the identification, collection, and preservation of electronically stored information (ESI) that resides “in the wild,” including user desktops, network file shares, databases, and in Exchange 2010. Investigators can tag items for legal hold, securing the ESI and retaining it in a protected repository. EMC SourceOne eDiscovery – Kazeon goes beyond mailbox search to extend Exchange 2010 by creating repeatable eDiscovery processes, thus reducing cost and risk and enabling good information governance and litigation.

To help our customers meet the challenges of information governance, eDiscovery, and litigation support, Microsoft Exchange 2010, EMC SourceOne Email Management, and EMC SourceOne eDiscovery - Kazeon work together to provide organizations with:

- A consolidated and centrally managed business archive
- Improved backup and recovery of e-mail and other file types through the business archive
- Enforcement and management of retention and disposition policies for Microsoft Exchange 2010 e-mail and other data types across the organization
- eDiscovery readiness for Microsoft Exchange 2010 e-mail and other file types, including PST files from earlier versions of Exchange
- Offloading of eDiscovery activities from the IT department to the legal department, freeing up IT resources and reducing costs

Summary

Microsoft and EMC provide compelling new capabilities for managing your Microsoft Exchange 2010 e-mail, while meeting security, compliance, and eDiscovery requirements. In particular, EMC SourceOne delivers a highly scalable, efficient, and cost-effective business archive to meet your legal obligations while improving your IT efficiency and reducing your management costs.
