As part of an effort to improve its product lines, EMC periodically releases revisions of its software and hardware. Therefore, some functions described in this document might not be supported by all versions of the software or hardware currently in use. The product release notes provide the most up-to-date information on product features.

Contact your EMC technical support professional if a product does not function properly or does not function as described in this document.

**Note**
This document was accurate at publication time. Go to EMC Online Support ([https://support.emc.com](https://support.emc.com)) to ensure that you are using the latest version of this document.

**Purpose**
This guide describes how to install the Avamar Virtual Edition solution, a single-node, non-RAIN Avamar server that runs as a virtual machine in a VMware ESX Server environment.

**Audience**
This document is intended for EMC Professional Services employees and EMC authorized channel partners who install AVE.

**Revision history**
The following table presents the revision history of this document.

<table>
<thead>
<tr>
<th>Revision</th>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
</table>

**Related documentation**
The following EMC publications provide additional information:

- *EMC Avamar Release Notes*
- *EMC Avamar Administration Guide*
- *EMC Avamar Operational Best Practices Guide*
- *EMC Avamar Product Security Guide*
- *EMC Avamar Backup Clients User Guide*

**Special notice conventions used in this document**
EMC uses the following conventions for special notices:

**NOTICE**
Addresses practices not related to personal injury.

**Note**
Presents information that is important, but not hazard-related.

**Typographical conventions**
EMC uses the following type style conventions in this document:
**Bold**  Use for names of interface elements, such as names of windows, dialog boxes, buttons, fields, tab names, key names, and menu paths (what the user specifically selects or clicks)

**Italic**  Use for full titles of publications referenced in text

**Monospace**  Use for:
- System code
- System output, such as an error message or script
- Pathnames, file names, prompts, and syntax
- Commands and options

**Monospace italic**  Use for variables

**Monospace bold**  Use for user input

[ ]  Square brackets enclose optional values

|  Vertical bar indicates alternate selections - the bar means “or”

{}  Braces enclose content that the user must specify, such as x or y or z

...  Ellipses indicate nonessential information omitted from the example

---

**Where to get help**
The Avamar support page provides access to licensing information, product documentation, advisories, and downloads, as well as how-to and troubleshooting information. This information may enable you to resolve a product issue before you contact EMC Customer Support.

To access the Avamar support page:

1. Go to [https://support.EMC.com/products](https://support.EMC.com/products).
2. Type a product name in the **Find a Product** box.
3. Select the product from the list that appears.
4. Click the arrow next to the **Find a Product** box.
5. (Optional) Add the product to the **My Products** list by clicking **Add to my products** in the top right corner of the **Support by Product** page.

**Documentation**
The Avamar product documentation provides a comprehensive set of feature overview, operational task, and technical reference information. Review the following documents in addition to product administration and user guides:

- Release notes provide an overview of new features and known limitations for a release.
- Technical notes provide technical details about specific product features, including step-by-step tasks, where necessary.
- White papers provide an in-depth technical perspective of a product or products as applied to critical business issues or requirements.
Knowledgebase
The EMC Knowledgebase contains applicable solutions that you can search for either by solution number (for example, esgxxxxxx) or by keyword.

To search the EMC Knowledgebase:
1. Click the **Search** link at the top of the page.
2. Type either the solution number or keywords in the search box.
3. (Optional) Limit the search to specific products by typing a product name in the **Scope by product** box and then selecting the product from the list that appears.
4. Select **Knowledgebase** from the **Scope by resource** list.
5. (Optional) Specify advanced options by clicking **Advanced options** and specifying values in the available fields.
6. Click the search button.

Online communities
Visit EMC Community Network at [http://community.EMC.com](http://community.EMC.com) for peer contacts, conversations, and content on product support and solutions. Interactively engage online with customers, partners and certified professionals for all EMC products.

Live chat
To engage EMC Customer Support by using live interactive chat, click **Join Live Chat** on the **Service Center** panel of the Avamar support page.

Service Requests
For in-depth help from EMC Customer Support, submit a service request by clicking **Create Service Requests** on the **Service Center** panel of the Avamar support page.

**Note**
To open a service request, you must have a valid support agreement. Contact your EMC sales representative for details about obtaining a valid support agreement or with questions about your account.

To review an open service request, click the **Service Center** link on the **Service Center** panel, and then click **View and manage service requests**.

Facilitating support
EMC recommends that you enable ConnectEMC and Email Home on all Avamar systems:
- ConnectEMC automatically generates service requests for high priority events.
- Email Home emails configuration, capacity, and general system information to EMC Customer Support.

Your comments
Your suggestions will help us continue to improve the accuracy, organization, and overall quality of the user publications. Send your opinions of this document to DPAD.Doc.Feedback@emc.com.

Please include the following information:
- Product name and version
- Document name, part number, and revision (for example, 01)
- Page numbers
- Other details that will help us address the documentation issue
CHAPTER 1

Introduction

This chapter includes the following topics:

- Overview of Avamar Virtual Edition for VMware ......................................................12
- Appropriate environments for AVE .............................................................................12
- Pre-sales performance analysis ............................................................................... 13
Overview of Avamar Virtual Edition for VMware

EMC® Avamar® Virtual Edition (AVE) is a single-node non-RAIN (Redundant Array of Independent Nodes) Avamar server that runs as a virtual machine in a VMware® ESXi 5.1/5.5/5.5u2/6.0 environment. AVE integrates the latest version of Avamar software with SUSE Linux as a VMware virtual machine.

AVE is similar to single-node Avamar servers in the following ways:
- Runs autonomously as a target for all Avamar client backups
- Performs replication to a physical Avamar system or another AVE

AVE is available in four configurations: 0.5 TB, 1 TB, 2 TB, and 4 TB licensed capacity. AVE is not scalable to a multi-node Avamar server and resizing the virtual machine is not supported. You can increase storage capacity by deploying additional AVE virtual machines, and then divide backups among them. Or you can replicate the data to another Avamar server, delete the smaller virtual machine, create a larger virtual machine, and replicate the data back to the larger virtual machine.

AVE supports backup of physical and virtual clients:
- For physical clients, install Avamar client software on each client.
- For virtual clients, there are two options for backups. Virtual clients can be backed up through guest OS backups (requires installing Avamar client software on each virtual machine) or through host-based backups (requires a proxy server).

Appropriate environments for AVE

The following factors have the most direct impact on the long-term reliability, availability, and supportability of the AVE virtual machine:
- I/O performance capability of the AVE storage subsystem
- Amount of data added daily to the AVE virtual machine (change rate)
- Capacity utilized within the AVE virtual machine

Specifications in this section and AVE virtual disk requirements on page 17 describe minimum or maximum requirements for these factors. AVE generally performs better when I/O performance is higher, and change rate and utilized capacity are lower. To maximize the capacity the AVE virtual machine can use, the daily change rate of the data AVE protects must be balanced with adequate I/O performance.

The first step in determining the proper implementation of AVE is to establish which kind of customer environment AVE will be used to protect, file server or mixed environment. File server environments include file system data and mixed environments include file system data and structured data (for example, database data).

The following table describes the maximum change rates that AVE supports for file server and mixed environments.

Table 1 Maximum change rates AVE supports for file server and mixed environments

<table>
<thead>
<tr>
<th>Configuration</th>
<th>File server data</th>
<th>Mixed data</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5 TB AVE</td>
<td>Less than 2 GB per day</td>
<td>Less than 5 GB per day</td>
</tr>
<tr>
<td>1 TB AVE</td>
<td>Less than 4 GB per day</td>
<td>Less than 10 GB per day</td>
</tr>
</tbody>
</table>
Table 1  Maximum change rates AVE supports for file server and mixed environments (continued)

<table>
<thead>
<tr>
<th>Configuration</th>
<th>File server data</th>
<th>Mixed data</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 TB AVE</td>
<td>Less than 8 GB per day</td>
<td>Less than 20 GB per day</td>
</tr>
<tr>
<td>4 TB AVE</td>
<td>Less than 20 GB per day</td>
<td>Less than 20 GB per day</td>
</tr>
</tbody>
</table>

Actual results depend on the retention policy and the actual data change rate. When the daily change rate exceeds the limits specified in the previous table, deploy a single or multi-node Avamar server.

Pre-sales performance analysis

Pre-sales performance analysis for AVE is required. It is performed by EMC-trained personnel. Server hardware and the virtual environment must meet resource capability benchmarks according to results from the AVE Performance Assurance Tool (PAT). This tool also simulates the load imposed on the ESXi Server so that the customer can gauge the potential impact on the targeted ESXi Server. After the PAT is complete, the instructions contain information on how to analyze the data collected and determine if the ESXi Server is a good candidate for AVE.

The AVE PAT must be run for a minimum of 24 hours prior to sale. For pre-sales purposes, download the PAT tool and its associated checksum file with the following FTP commands:

ftp://avamar_ftp:anonymous@ftp.emc.com/software/PAT/PAT-4.zip
ftp://avamar_ftp:anonymous@ftp.emc.com/software/PAT/PAT-4.zip.md5

Use the checksum file to verify the PAT file was properly downloaded.

Note

Previous versions of AVE also required running the Benchmark Test prior to installation. If the PAT completes successfully with acceptable load levels, the Benchmark Test is not required. If you experience problems during installation and suspect it is bandwidth related, Benchmark Testing on page 25 is documented for troubleshooting purposes.
CHAPTER 2

Installation

This chapter includes the following topics:

- Preinstallation requirements and best practices .............................................. 16
- Installation ......................................................................................................... 18
Preinstallation requirements and best practices

Before you install an AVE virtual machine, follow the preinstallation requirements and review the best practices in the following sections.

**Note**

Using third party tools to create clones or exact copies of deployed Avamar Virtual Edition systems is known to cause issues. Cloning of Avamar Virtual Edition systems is not supported.

System requirements

Avamar Virtual Edition (AVE) is supported on VMware ESXi 5.1/5.5/5.5u2/6.0.

The following table defines the minimum system requirements for each size of AVE.

<table>
<thead>
<tr>
<th></th>
<th>0.5 TB AVE</th>
<th>1 TB AVE</th>
<th>2TB AVE</th>
<th>4 TB AVE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processors</td>
<td>Minimum two 2 GHz processors</td>
<td>Minimum two 2 GHz processors</td>
<td>Minimum two 2 GHz processors</td>
<td>Minimum four 2 GHz processors</td>
</tr>
<tr>
<td>Memory</td>
<td>6 GB</td>
<td>8 GB</td>
<td>16 GB</td>
<td>36 GB</td>
</tr>
<tr>
<td>Disk space</td>
<td>900 GB</td>
<td>1,650 GB</td>
<td>3,150 GB</td>
<td>6,150 GB</td>
</tr>
<tr>
<td>Network connection</td>
<td>1 GbE connection</td>
<td>1 GbE connection</td>
<td>1 GbE connection</td>
<td>1 GbE connection</td>
</tr>
</tbody>
</table>

**Note**

If you are using VMFS3 datastores, for 250 GB virtual disks, use at least 1 MB block size for your VMFS datastore filesystem. For 1000 GB disks, use at least a 4 MB block size for your VMFS3 datastore file system. For VMFS5 the block size is automatically defined.

Verifying the DNS configuration

Prior to installing AVE, DNS must be properly configured. Failure to have DNS set up properly can cause runtime or configuration issues.

**Procedure**

1. Open a command prompt on the vCenter Server and type the following command:

   \[ \text{nslookup AVE\_IP\_address DNS\_Server\_IP\_address} \]

   The `nslookup` command will return the FQDN for AVE.

2. Type the following command:

   \[ \text{nslookup AVE\_FQDN DNS\_Server\_IP\_address} \]

   The `nslookup` command will return the IP address for AVE.

3. Type the following command:

   \[ \text{nslookup FQDN\_of\_vCenter DNS\_Server\_IP\_address} \]
The `nslookup` command returns the IP address of the vCenter Server.

4. If the `nslookup` commands returned the proper information, close the command prompt. If the `nslookup` commands do not return proper information, resolve the DNS configuration before you install AVE.

**AVE virtual disk requirements**

The AVE disk layout comprises one operating system disk (126 GB) and several storage partitions (250 GB or 1000 GB depending on the AVE configuration).

The OS disk stores the operating system, Avamar application and log files.

The storage partitions store the backup data. Backup data is evenly distributed across the storage partitions. The primary amount of the disk read, write, and seek usage occurs on the storage partitions. To improve performance in the storage configuration, distribute storage partitions across high performance LUNs.

In addition to the OS partition, the following table defines the number and size of virtual disks required for each AVE configuration.

<table>
<thead>
<tr>
<th>AVE configuration</th>
<th>Number of virtual disks</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5 TB</td>
<td>3 storage partitions (250 GB each)</td>
</tr>
<tr>
<td>1 TB</td>
<td>6 storage partitions (250 GB each)</td>
</tr>
<tr>
<td>2 TB</td>
<td>3 storage partitions (1000 GB each)</td>
</tr>
<tr>
<td>4 TB</td>
<td>6 storage partitions (1000 GB each)</td>
</tr>
</tbody>
</table>

**Note**

For 250 GB virtual disks, use at least 1 MB block size for your VMFS datastore file system.
For 1000 GB disks, use at least a 4 MB block size for your VMFS datastore file system.

**Software requirements**

Before you install AVE, ensure you have the software listed in the following table.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applications</td>
<td>PuTTY and WinSCP</td>
</tr>
<tr>
<td>Files</td>
<td>AVE Package, operating system security patches (if applicable)</td>
</tr>
</tbody>
</table>

**Network requirements**

Before you install AVE, gather the following information:

- Hostnames and IP addresses for the AVE virtual machine and the DNS Server
- Gateway, netmask, and domain of the AVE virtual machine
- Firewall openings, if applicable
The **EMC Avamar Product Security Guide** provides client-server data port usage and firewall requirements.

**Virtual disk configuration best practices**

ESXi supports multiple disk formats. For AVE virtual machines, the initial configuration is Thick Provision Lazy Zeroed.

**Note**

AVE does not support thin provisioning.

After the initial installation, if you configure the virtual disks for the Thick Provision Eager Zeroed, the customer will get better initial performance because the first write to the disk will require less operations.

**Note**

See the VMware documentation for information on converting Lazy zeroed virtual disks to Eager zeroed virtual disks. Converting a disk from Thick Provisioned Lazy Zeroed to Thick Provisioned Eager Zeroed is time consuming and can consume a significant number of storage I/O processes.

A virtual machine running AVE aggressively uses disk I/O and is almost never idle. VMware’s recommendations for appropriate resources for high-performance database virtual machines are generally applicable to an AVE virtual machine. In particular, a storage pool allocated from a group of dedicated physical disks in a RAID 1 (mirror) or RAID 10 (combines RAID 0 with RAID 1) configuration provides the best performance.

**Installation**

The following sections are describe how to install an AVE virtual machine.

**Preparing the virtual machine**

The following instructions use vCenter Server 5.5. Other versions of vCenter Server might have different options.

**Procedure**

1. Download the AVE virtual appliance file for the appropriate version of AVE you are installing.
2. Extract the compressed .7z file.
3. Start a VMware vSphere Client and connect to the vCenter Server or to the ESXi host that will host the AVE virtual machine.
4. Log in with administrative rights.
5. If you logged into vCenter, select the ESXi server that will host the AVE virtual machine.
   - The Source page appears.
7. Select Deploy from a file or URL and browse to the AVE virtual machine file (OVF extension) and click **Next**.
The OVF Template Details page appears.
8. Verify the template details are correct and click Next.

The Name and Location page appears.
9. Type in the AVE name, select the inventory location, and then click Next.

The Storage page appears.
10. Select the storage for AVE and click Next.

The Disk Format page appears.
11. Select Thick Provision Lazy Zeroed format and click Next.

Thin provisioning is not supported with AVE.

The Network Mapping page appears.
12. Select the destination network and click Next.

The Ready to Complete page appears.
13. Confirm the deployment settings are correct and click Finish.

The installation may take several minutes. A Deployment Completed Successfully message appears when the installation is complete.

14. Click Close.
15. Right-click the AVE virtual machine and select Edit Settings.

The Virtual Machine Properties window appears.
16. On the Hardware tab, select Memory and set Memory Size based on the size of the AVE license:
   - For 0.5 TB AVE, specify 6 GB
   - For 1 TB AVE, specify 8 GB
   - For 2 TB AVE, specify 16 GB
   - For 4 TB AVE, specify 36 GB

17. On the Hardware tab, select CPUs and change the number of virtual CPUs based on the size of the AVE license:
   - For 0.5 TB AVE, specify 2 CPUs.
   - For 1 TB AVE, specify 2 CPUs.
   - For 2 TB AVE, specify 2 CPUs.
   - For 4 TB AVE, specify 4 CPUs.

18. On the Hardware tab, select Network adapter 1, choose the Network Connection (Network label), and then select the correct network.

19. Create additional virtual hard disks (VMDKs) for the AVE virtual machine based on the specifications from AVE virtual disk requirements on page 17.

Thin provisioning is not supported with AVE.

a. Click the Add button.

The Add Hardware Wizard appears.

b. Select Hard Disk.

c. Click Next.
d. Select Create a new virtual disk.

e. Click Next.

f. For Disk Size, type 250 GB (or 1000 GB if you are implementing a 2 or 4 TB AVE).

g. For Disk Provisioning select Thick Provision Lazy Zeroed format.

   If you select Thick Provision Eager Zeroed during the installation, the installation could take several hours. Time-out errors could also occur. See AVE virtual disk requirements on page 17 for information about disk formatting after the installation process is complete.

h. For Location, select either Store with virtual machine or Specify a datastore.

i. Click Next.

j. For Mode select Independent. Use the default setting for Persistent.

k. Click Next.

l. Verify the configuration and select Finish.

m. Repeat these steps based on your AVE configuration:

   • For 0.5 TB AVE, repeat two more times (for a total of three 250 GB hard drives).
   • For 1 TB AVE, repeat five more times (for a total of six 250 GB hard drives).
   • For 2 TB AVE, repeat two more times (for a total of three 1000 GB hard drives).
   • For 4 TB AVE repeat five more times (for a total of six 1000 GB hard drives).

20. Finalize virtual machine configuration by completing the following steps:

   a. Click OK.

   b. In the Recent Tasks status area (bottom of screen), observe the progress of the hard drive creation.

   When the status of the reconfigured Virtual Machine is complete, a Completed message appears.

21. Right-click the virtual machine and select Power > Power On. This command boots the virtual machine.

22. Open the Virtual Console to monitor installation progress.

   An insufficient licensing message at this point might indicate either a shortage of ESXi Server licenses or an inability to connect to a license server. Resolve this problem with the network administrator.

23. On the Summary tab, verify the status for VMware Tools changes to Running or Unmanaged.

**Configuring network settings**

The following procedure is used to configure AVE network configuration for a single IP address.

---

**Note**

If you need to run the Benchmark Test, skip this section and proceed to GUID-0DDEB048-16D4-40D1-B581-8862ADDA54CC.
Note
If you require dual-mode stack configuration (to support IPv4 and IPv6) refer to the SLES Unix YAST2 documentation.

Procedure
1. At the command prompt, type the following command:
   ```
yast2
   ```
2. Press Enter.
   In YaST2, pressing Ctrl-H backspaces over data to delete existing data.
   The YaST2 Control Center dialog box appears.
   The Network Devices dialog box appears.
5. From Network Settings use the Tab key to access the Edit option and press Enter.
6. From the Network Card Setup use the Tab key to access and select **Statically assigned IP Address** (select using the spacebar). Tab to IP Address and type in the IP Address, the Subnet Mask, and the Hostname of the AVE virtual machine.
7. Use the Tab key to select Next and press Enter.
8. From Network Settings, use the Tab key to select Overview. Use the right-arrow key to select Hostname/DNS. Use the Tab key to specify the following fields:
   a. Hostname
   b. Domain Name
   c. Name Server 1
   d. Name Server 2
   e. Domain Search
9. Use the Tab key to select Hostname/DNS. Use the right-arrow key to select Routing. Type in the Default Gateway IP address for the AVE virtual machine. Use the Tab key to select OK, and then press Enter.
10. From the YaST Control Center, use the Tab key to select Quit and press Enter.

Before proceeding, it is critical to confirm the network settings configured through YaST2 are correct. Verify that all of the configuration files edited through YaST2 are properly configured. Refer to the SLES Unix YAST2 documentation for additional information.

11. Wait a couple of minutes and verify the preceding data by typing the following command:
   ```
   ifconfig
   ```
12. Verify basic network configuration of eth0 typing the following command:
   ```
   ping Static-IP-Address
   ```
13. Verify basic network configuration by typing the following commands:
   ```
   ping gateway_IP_Address
   ping DNS_IP Address
   ```
Installing and configuring Avamar software

To install Avamar software on a new AVE virtual machine, complete the following procedure:

**Procedure**

1. Log in to the Avamar Installation Manager user interface as root.
2. Open a web browser and type the following URL:
   
   `https://Avamar-Server:7543/avi/avigui.html`
   
   where `Avamar-Server` is the hostname or the IP address of the Avamar virtual machine.

   The EMC Avamar Installation Manager login page appears.
3. If any security messages appear, click Continue.

   The EMC Avamar Installation Manager dialog box appears.
4. In the User field type `root`.
5. In the Password field type `changeme`.
6. Click Login.
7. Click the SW Updates tab and click the Unlock icon in the upper right corner of the dialog page.

   The Passcode dialog box appears.
8. Type in the support password `Supp0rtHarV1` and click OK.

   The EMC Avamar Installation Manager dialog box appears. This screen can take a few minutes to populate.
9. After a few minutes, click the Refresh icon on your web browser to see the installation package.
10. Click the Install button.

    The installation initialization begins. The initialization extracts files from the package and prepares the environment for the installation. The process can take a few minutes.
11. Once the initialization completes, the Installation Setup page appears. Note that the tabs with a red exclamation mark (!) are required for the installation.

    By default, the Network Config tab is open.
12. Type a value of 0 and click Save.
13. Click the ConnectEMC tab and specify the following:

    a. For Email sender address type `sender email address for email notification`
    b. For Email server type `Hostname of email server for notification emails to EMC`
    c. For Site name type `Description of Avamar server location`
    d. For Email Server IP Protocol select `IP Protocol used by the email server`
    e. Click Save
14. Click the Install Patches tab. Install available patches, and then click Save.
15. Click the Passwords tab, and then specify and confirm passwords. Make sure you note these for the customer. Click Save.
16. Click the Customer Contact Info tab, and then specify the customer contact information and click Save.

17. (Optional) To set Security Settings, click the Security Settings tab and then configure applicable security settings. Click Save.

18. Click the Server Settings tab. Leave the Avamar Server Address field blank. Select the applicable System time zone name and click Save. Click Continue.

The Avamar configuration begins. Wait until the process completes.

Note
Please check for the latest available security rollup released and install if applicable

Note
Once AVE is installed, see the EMC Avamar Administration Guide for additional information on setting up and configuring Avamar.
APPENDIX A

Benchmark Testing

This appendix includes the following topics:

- Running ave-part.pl ................................................................. 26
- Running benchmark testing ....................................................... 26
- Starting benchmark testing ....................................................... 26
- Manually ending benchmark testing ........................................ 27
- Analyzing benchmark results .................................................. 27
- Benchmark removal ............................................................... 29
- Benchmark failure ............................................................... 29
Running ave-part.pl

The `ave-part.pl` command is used to create AVE partitions before the Benchmark Test is run.

**Procedure**

1. In the vSphere Client, select the AVE virtual machine and click the **Console** tab.
2. Click in the middle of the **Console** to put it into command mode and press **Enter**.
   
   Press Ctrl-Alt to regain mouse control.
3. Log in to the guest as root.
4. When prompted for a password, type `changeme` and press **Enter**.
5. Configure the virtual hard drives by typing the following command and pressing **Enter**:
   
   ```bash
   /usr/local/avamar/bin/ave-part.pl
   ```
   
   When all actions are completed and a **Script Complete!** message appears in the command shell. This script can take several minutes to complete.

Running benchmark testing

The benchmark test is essentially the same as the Performance Analysis Tool (PAT). If the PAT passes, you should not need to use the benchmark test. However, if the configuration changes or additional load is added to the ESXi host between the PAT and the AVE deployment, I/O performance might change to unacceptable levels.

There are two purposes for this test:

- To ensure the AVE virtual machine runs in an environment with acceptable I/O performance.
- To stress virtual machine resources to determine whether the impact of running an AVE virtual machine is acceptable to other applications on the ESXi host.

**Note**

Before running the benchmark test, warn the customer that the test will induce a high load on the ESXi host. Monitor the ESXi host performance while the tool is running to determine whether the stress on resources is acceptable. If not, end the test by following the instructions in **Manually ending benchmark testing** on page 27.

Starting benchmark testing

The following steps are used to start the benchmark test:

**Procedure**

1. On the **vSphere Client Console** tab, log in to the guest as root.
2. When prompted for a password, type `changeme` and press **Enter**.
   
   All remaining instructions in this procedure assume that you are logged in to the guest, and not into the ESXi Server.
3. Run the benchmark test by typing the following command:
   
   ```bash
   /usr/local/avamar/bin/24hr-benchmark.sh &
   ```
While the test is running, monitor the host ESXi Server’s performance. If the stress on resources is unacceptable, end the test with the instructions. See Manually ending benchmark testing on page 27 for more detail.

The test runs for 24 hours unless it is manually ended (see next section). This command also copies operational status data to a log file.

4. After 24 hours, confirm the test has successfully ended by typing the following command:

```
ps -ax | grep benchmark
```

Blank output indicates the test is complete.

5. Save test results by typing the following commands:

```
cd /root
```

```
tar –cvf CUSTOMERNAME_benchmark-results.tar YYYYMMDD_benchmark
```

where YYYYMMDD_benchmark is the directory automatically created by the start of the test.

---

**Manually ending benchmark testing**

By default, the benchmark test runs for 24 hours and does not need to be manually ended. If the stress on resources is unacceptable, the following steps can be used to manually end benchmark testing.

**Procedure**

1. Type the following command on the vCenter Client Console tab:

```
/usr/local/avamar/bin/kill-benchmark.sh
```

2. Wait at least 30 seconds, and then type the following command:

```
ps ax | grep benchmark
```

Blank output indicates the test has been stopped.

3. Delete data from the following directory:

```
/usr/local/avamar/bin/
```

Blank output indicates the test is complete.

---

**Analyzing benchmark results**

Test results are written to:

```
/DIRECTORY/dt_std_HOSTNAME_summary
```

```
/DIRECTORY/seektest_only_summary_1 files
```

The following table lists minimal acceptable benchmark test results for 0.5 TB AVE:

<table>
<thead>
<tr>
<th>Conditions</th>
<th>File server data</th>
<th>Mixed data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Minimal Read Throughput</td>
<td>60 MB/sec</td>
<td>75 MB/sec</td>
</tr>
</tbody>
</table>
Table 5 0.5 TB AVE minimum benchmark test results (continued)

<table>
<thead>
<tr>
<th>Conditions</th>
<th>File server data</th>
<th>Mixed data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Read Throughput</td>
<td>60 MB/sec</td>
<td>75 MB/sec</td>
</tr>
<tr>
<td>Total Minimal Write Throughput</td>
<td>30 MB/sec</td>
<td>60 MB/sec</td>
</tr>
<tr>
<td>Total Write Throughput</td>
<td>30 MB/sec</td>
<td>60 MB/sec</td>
</tr>
<tr>
<td>Total Seek Minimal Throughput for 4 Threads</td>
<td>320 seeks/sec</td>
<td>320 seeks/sec</td>
</tr>
<tr>
<td>Total Seek Throughput for 4 Threads</td>
<td>400 seeks/sec</td>
<td>400 seeks/sec</td>
</tr>
</tbody>
</table>

The following table lists minimal acceptable benchmark test results for 1 TB AVE:

Table 6 1 TB AVE minimum benchmark test results

<table>
<thead>
<tr>
<th>Conditions</th>
<th>File server data</th>
<th>Mixed data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Minimal Read Throughput</td>
<td>80 MB/sec</td>
<td>100 MB/sec</td>
</tr>
<tr>
<td>Total Read Throughput</td>
<td>80 MB/sec</td>
<td>100 MB/sec</td>

Benchmark removal

Once the benchmark test is complete, it can be removed by typing the following command in the vSphere Client **Console** tab as root user:

**Procedure**

- `/usr/local/avamar/bin/dtsh --cleanup`

Benchmark failure

If minimum acceptable benchmark results cannot be achieved, delete the virtual machine by performing the following:

**Note**

Do not perform the following procedure if benchmark results are satisfactory. In that case, continue installing AVE.

**Procedure**

1. Log in as root.
   
   When prompted for a password, type `changeme` and press **Enter**.

2. On the **vSphere Client Console** tab, type the following command:
   
   `poweroff`

3. In left pane, right-click the virtual machine you want to remove.

4. Select **Delete from Disk**.
