Abstract

This design guide describes technical considerations and best practices for integrating VMware Horizon brokering software with Dell EMC VxRail appliances or vSAN Ready Nodes to create virtual application and desktop environments on 14th generation Dell EMC PowerEdge servers in a VMware vSphere environment.

Executive summary

Business challenge

In the past, moving from traditional PCs to a virtual desktop infrastructure (VDI) solution was challenging. A classic VDI implementation of 100 applications and 1,000 users could take 250 days or more, and the final cost was often unpredictable. Organizations today require end-to-end desktop and application virtualization infrastructure solutions that are flexible, reliable, scalable, and easy to deploy.

Desktop virtualization helps improve service delivery and competitiveness by simplifying how IT works on systems, dramatically reducing the complexity of the system and making it more flexible. The IT team can then move from being a largely reactive technical group to playing a proactive role in the strategic organization. Dell EMC can assist IT teams in this journey while improving user experience with the Dell EMC Ready Architectures for VDI.

Some challenges that organizations face today include:

- **Workforce empowerment**— Personal technology is driving newer and higher expectations. People want the same benefits at work as they have on their personal devices. They want faster, easier-to-use devices and applications that fit their specific needs. Technology itself has become a way to attract and retain the best talent. It has become a differentiator and a job perk.

- **Optimized IT resources**—Organizations that manage a large number of traditional PCs find that the task is becoming increasingly complex. With desktop virtualization, you move applications, data, and the OS (the desktop) to the data center. IT can centrally manage the virtual desktop from the data center and save time and money by troubleshooting PCs remotely instead of physically visiting each PC.

- **Improved security**—Organizations require the ability to control data, recover from disasters, apply policies, comply with regulations, and monitor risk. Maintaining data and application security, as well as compliance, are the leading IT concerns in organizations of all sizes. Mobile office trends and bring-your-own device initiatives mean that more devices and sensitive data are out of direct IT control, increasing the risk for data theft, viruses, malware, and ransomware attacks. In addition, traditional antivirus solutions cannot keep up with the amount of new malware that is created daily. Non-security IT specialists also tend to find security and compliance complex.

- **Cost management**—Organizations must monitor and optimize the total cost of ownership (TCO), achieve greater utilization from infrastructure assets, and reduce energy use.
Technology solution

Dell EMC Ready Architectures for VDI on vSAN-based appliances provide a quick and easy way to simplify and extend your VMware environment. Since Ready Architectures for VDI combine compute, storage, virtualization, and management, these solutions are ideal for VDI.

The Ready Architectures for VDI are built on industry-leading Dell EMC VxRail appliances or vSAN Ready Nodes appliances. These true hyper-converged infrastructure (HCI) platforms provide performance, flexibility, and scale for VDI environments.

- Dell EMC recommends VxRail appliances for an enhanced VDI solution that leverages a wide range of software, tools, and resources co-developed by Dell EMC and VMware. The VMware hyper-converged software is vSphere-ready and based on vSAN Software-Defined Storage (SDS). The Dell EMC deployment and support tools integrate the software management within VxRail Manager. Data protection and replication are included and can support either hybrid or all-flash storage configurations.

- Dell EMC vSAN Ready Nodes do not include the full automation suite that is available in VxRail appliances, but they provide more flexibility in platform choices. vSAN Ready Nodes offer the confidence that your pre-validated configuration will work with vSAN technology as well as the VMware Horizon 7 suite.

Installing VMware Horizon 7 with its VDI components on VxRail appliances or vSAN Ready Nodes enables organizations to quickly deliver Microsoft Windows virtual desktops or server-based hosted shared sessions on a wide variety of endpoint devices.

Key benefits

Dell EMC offers comprehensive, flexible, and efficient VDI solutions that are designed and optimized for your organization's needs. These VDI solutions are easy to plan, easy to deploy, and easy to run.

With two different vSAN-based appliance options to choose from, Dell EMC has the ideal configuration to start or extend your data center. While VxRail and vSAN Ready Nodes have the same underlying technology (VMware vSAN), each provides unique benefits. VxRail offers a turn-key solution to deploying and managing infrastructure with additional software features to assist throughout the appliance lifecycle. vSAN Ready Nodes require similar architectural design elements, but do not include the software components and elements that are found in the VxRail product. However, vSAN Ready Nodes offer a greater array of platforms and additional peripheral device choices.

Dell EMC Ready Architectures for VDI offer several key benefits:

- **VxRail Manager lifecycle management**—The integrated VxRail software lifecycle management keeps software updates and patches current. Updates are easy to install and safe to implement, because all software components are engineered, tested, and released as a bundle. Administrators are notified through the VxRail Manager when updates are available. Perform updates in your production environment with no downtime while VxRail Manager intelligently deploys important updates. VxRail Manager lifecycle management reduces complexity, makes the infrastructure more secure, and removes the risk. (VxRail Manager is available only on VxRail.)
• **Predictable costs, performance, and scalability to support a growing workforce**—The cost to deploy applications and desktops is dramatically simpler when deploying from a data center.

• **Rapid deployments**—Ready Architectures for VDI offer rapid automated deployment. (This feature is a standard offering on VxRail with optional services available for vSAN Ready Nodes.)

• **Rapid scaling to serve enterprises of any size**—Scale rapidly with workload-specific configurations per platform. The solution is scalable up to 64 nodes per cluster, supporting thousands of virtual machines (VMs). Continue scaling with pod architecture and by combining multiple clusters. The VxRail Manager (available only with VxRail appliances) makes it easy to insert or remove nodes from your cluster to meet your business needs.

• **Dell EMC support**—Dell EMC Ready Architectures for VDI are tested and validated Engineering Systems for VDI and its related tools. Deployment Services provide installation of this turn-key VDI appliance to ensure a rapid deployment with linear and predictable scalability.

Dell EMC offers single-company-support models for Horizon and vSAN-based solutions.

**Document purpose**

This document introduces the architecture, components, design options, best practices, and configuration details for successful VDI deployments for VxRail appliances and vSAN Ready Nodes with VMware Horizon 7.

**Audience**

This guide is for decision makers, managers, architects, developers, and technical administrators of IT environments who want an in-depth understanding of the value of the Ready Architectures for VDI that deliver Microsoft Windows virtual desktops to users using VMware Horizon 7 VDI components on VxRail appliances or vSAN Ready Nodes.

**We value your feedback**

Dell EMC and the authors of this document welcome your feedback on the solution and the solution documentation. Contact the Dell EMC Solutions team by email or provide your comments by completing our documentation survey.

**Authors:** Dell EMC Ready Architectures for VDI team, Donna Renfro

**Note**

The following page on the Dell EMC Communities website provides links to additional documentation for VDI Ready Solutions: VDI Info Hub for Ready Solutions.
Solution architecture

This section provides an architecture overview and guidance on managing and scaling a VMware Horizon 7 environment on Dell EMC VxRail appliances.

Architecture overview

The following figure depicts the architecture of the validated solution, including the network, compute, management, and storage layers. This architecture aligns with the VMware Horizon Block/Pod design. A pod is divided into multiple blocks. Each block is made up of one or more vSphere clusters, a vCenter, and, for linked clones, a composer server.

Figure 1 VxRail Appliance or vSAN Ready Nodes with VMware Horizon

The deployment option for this Dell EMC Ready Architecture for VDI supports all cloning techniques available from VMware: full, linked, and instant.

A vSphere Cluster can have a maximum of 64 nodes and 8,000 VMs per cluster. To expand from this limit, you can add clusters and balance the VMs and nodes across the new clusters.
The Horizon 7 Enterprise Edition Reference Architecture provides more information about Horizon pods and blocks.

**Scaling the solution**

vSAN-based solutions provide flexibility as you scale, reducing the initial and future cost of ownership. Add additional physical and virtual servers to the server pools to scale horizontally. Add virtual resources to the infrastructure to scale vertically.

**Scaling out**

Each component of the solution architecture scales independently depending on the required number of supported users. You can add appliance nodes at any time to expand the vSAN SDS pool in a modular fashion. The scaling limit for vSAN is restricted by the limits of the hypervisor at 64 nodes per block.

The boundary for a Horizon block is the vCenter. The number of virtual machines a vCenter (and therefore a block) can host depends on the type of Horizon 7 VMs being used. The recommendation limits for a Horizon block are as follows:

- 5,000 instant-clone VMs (without App Volumes)
- 4,000 linked-clone or full-clone VMs (without App Volumes)
- 2,000 VMs (all clone types) if App Volumes or AppStacks are attached

This Ready Architecture for VDI uses instant clones, as shown in the following figures. VMware recommends a limit of 5,000 instant-clone VMs per block. With these limits in mind, 25 compute nodes with 200 Task-User VMs per Node would reach the maximum number of VMs for the block.

The following figure shows a 5,000-user Horizon block.

**Figure 2** Single 5,000-user block

The following figure shows a scale-out to a 20,000-user Horizon vSAN pod with 5,000 user blocks. Each block contains its own vCenter Server instance and VDI components.
**Figure 3** Scaleout for 20,000 users

Scaling up
Dell EMC recommends a validated disk configuration for general purpose VDI. These configurations leave drive slots available for future vertical expansion and ensure that you protect your investment as new technology transforms your organization.

*Note*
These configurations can accept additional or faster processors or memory than the guidance provided here.

The VMware Workspace ONE and VMware Horizon 7 Enterprise Edition On-premises Reference Architecture provides more information about Horizon pod/block architecture and scaling.

**Enterprise solution pods**

The compute, management, and storage layers are converged into a single VxRail Appliance or vSAN Ready Nodes block, hosting VMware vSphere. The number of nodes that are supported for vSphere 6.5 or 6.7, which is 64, determines the recommended boundaries of an individual vSphere cluster.

Dell EMC recommends that the VDI management infrastructure nodes be separated from the compute resources. Because our test environment was small, both management and compute are in the same vSphere HA cluster. Optionally, the management node can also be used for VDI VMs with an expected reduction of 30 percent of host resources for these nodes only. The 30 percent accounts for management VM resource reservations and should be factored in when sizing.

Compute hosts can be used interchangeably for Horizon Apps hosted applications and desktops, as required.

This design guide describes a single-site or single data center design. For multi-site or disaster recovery (DR) configurations, refer to the Horizon 7 Enterprise Edition Multi-Site Reference Architecture.
Key components

This section describes the key hardware and software components of the solution.

VxRail Appliance

The Dell EMC VxRail is a powerful Hyper-converged Infrastructure Appliance (HCIA) that is available in 1U or 2U rack building blocks. It is built on VMware vSAN technology and further enabled with Dell EMC software.

The following figure shows the components of the VxRail appliance.

**Figure 4 Dell EMC VxRail appliance**

VxRail appliance platforms are equipped with Intel Xeon Scalable Processors. You can deploy a cluster with as few as three nodes, providing an ideal environment for small deployments. To achieve full vSAN high availability (HA), the recommended starting block is four nodes. The VxRail Appliance can support storage-heavy workloads with storage-dense nodes, graphics-heavy VDI workloads with GPU hardware, and entry-level nodes for remote and branch office environments.

The VxRail appliance enables you to start small and scale as your requirements increase. Single-node scaling and low-cost entry point options give you the freedom to buy just the right amount of storage and compute resources to start, and then add capacity to support growth. A single-node VxRail V Series appliance can be configured with 16 to 56 CPU cores per node and support a maximum of 40 TB raw storage with a hybrid configuration of 76 TB with the all-flash option. A 64-node all-flash cluster delivers a maximum of 3,584 cores and 4,864 TB of raw storage. The following table shows the available platforms.

**Table 1 Available Dell EMC VxRail platforms**

VxRail Manager

VxRail Manager, which is available on VxRail appliances only, is the primary deployment and element manager interface of the appliance. VxRail Manager simplifies the entire lifecycle from deployment through management, scaling, and maintenance. It also enables single-click upgrades and dashboard monitoring for health, events, and physical views.

vSAN Ready Nodes

vSAN Ready Nodes are pre-validated Dell EMC Server configurations that reduce the complexity of deploying vSAN technology. vSAN Ready Nodes configurations are listed in the vSAN Ready Node compatibility guide on the VMware website. vSAN Ready Nodes provide more customized hardware and platforms to meet your data center needs.

Because vSAN Ready Nodes do not offer lifecycle management and additional bundled software, Dell EMC recommends customized deployment services and at least three years of ProSupport Plus. Add VMware Horizon 7 Advanced or Enterprise to license your Dell EMC vSAN Ready Nodes for a full VDI deployment.

Dell EMC Ready Architectures VDI-optimized configurations

For graphics-intensive desktop deployments, we recommend the VDI-optimized 2U/1 Node appliances that support GPU hardware.

The VxRail V Series and vSAN Ready Nodes R740XD can be configured with or without GPUs. Dell EMC also offers similar configurations in a 1U/1 Node appliance, although graphics configurations are not available on these platforms.

We have designated common configurations as A3, B5, and C7. These designations are referenced throughout the documentation.

a. Only available with vSAN Ready Nodes based on the R740xd platform. NVIDIA Pascal P4 is the only FLSW card available at this time.
vSAN software-defined storage

vSAN is available in hybrid or all-flash configurations. After vSAN is enabled on a cluster, all disk devices presented to the hosts are pooled together to create a shared data store that is accessible by all hosts in the VMware vSAN cluster. VMs can then be created with storage policies assigned to them. The storage policy dictates availability, performance, and sizing.

vSAN provides the following configuration options:

- **Hybrid configuration**—Uses flash-based devices for the cache tier and magnetic disks for the capacity tier. Hybrid configurations are ideal for clients looking for higher volume in the capacity tier. The performance of SSD and magnetic spinning disks is comparable in VDI applications.

- **All-flash configuration**—Uses flash for both the cache tier and capacity tier to deliver enterprise performance and a resilient storage platform. In this configuration, the cache tier is fully dedicated to writes, allowing all reads to come directly from the capacity tier. This model allows the cache device to protect the endurance of the capacity tier. All-flash configured solutions enable data deduplication features to extend the capacity tier.

NVIDIA GPU

NVIDIA GPU accelerators provide high performance for demanding enterprise data center workloads. In applications ranging from energy exploration to deep learning, scientists can now process petabytes of data up to ten times faster than with CPUs. NVIDIA accelerators deliver the horsepower that is required to run large simulations faster than ever before. For enterprises deploying VDI, NVIDIA accelerators are perfect for accelerating virtual desktops. GPUs can be used in the V570 or V570F appliance configurations or on vSAN Ready Nodes that are built on the PowerEdge R740xd chassis.

Physical network components

Ready Architectures for VDI for appliances allow for flexibility in networking selections. VDI validations have been successfully performed with the following hardware, although several other choices are available.

- **Dell EMC Networking S3048 (1 GbE ToR switch)**—The S3048 switch accelerates applications in high-performance environments with a low-latency top-of-rack (ToR) switch that features 48 x 1 GbE and 4 x 10 GbE ports, a dense 1U design, and up to 260 Gbps performance. The S3048-ON also supports Open Network Installation Environment (ONIE) for zero-touch installation of alternate network operating systems.

- **Dell EMC Networking S4048 (10 GbE ToR switch)**—The S4048 switch optimizes your network for virtualization with a high-density, ultra-low-latency ToR switch that features 48 x 10 GbE SFP+ and 6 x 40 GbE ports (or 72 x 10 GbE ports in breakout mode) and up to 720 Gbps performance. The S4048-ON also supports ONIE for zero-touch installation of alternate network operating systems.

Dell EMC Networking S-Series 10GbE switches on the Dell EMC website provides more information about these switches.
Note

Ensure that you comply with the switch requirements in the VxRail Networking Guide, which provides important information, recommendations, and best practices for VxRail. Consider the same recommendations for vSAN Ready Nodes.

Networking

Designed for true linear scaling, VxRail appliances use a leaf-spine network architecture, which consists of two network tiers: an L2 Leaf and an L3 Spine that is based on 40 GbE and non-blocking switches. This architecture maintains consistent performance without any throughput reduction.

VMware vSphere

VMware vSphere provides a powerful, flexible, and secure foundation for business agility that accelerates the digital transformation to cloud computing and promotes success in the digital economy.

vSphere provides the following benefits for VDI applications:

- **Improved Appliance Management**—The vCenter Server Appliance Management interface provides CPU and memory statistics, network and database statistics, disk space usage, and health data. These features reduce reliance on a command-line interface for simple monitoring and operational tasks.

- **VMware vCenter Server native high availability**—This solution for vCenter Server Appliance consists of active, passive, and witness nodes that are cloned from the existing vCenter Server instance. The vCenter HA cluster can be enabled, disabled, or destroyed at any time. Maintenance mode prevents planned maintenance from causing an unwanted failover. The vCenter Server database uses Native PostgreSQL synchronous replication, while key data outside the database uses a separate asynchronous file system replication.

- **Backup and Restore**—Native backup and restore for the vCenter Server Appliance enables users to back up vCenter Server and Platform Services Controller appliances directly from the VAMI or API. The backup consists of a set of files that is streamed to a selected storage device using SCP, HTTP(S), or FTP(S) protocols. This backup fully supports VCSA instances with both embedded and external Platform Services Controller instances.

- **VMware vSphere HA Support for NVIDIA GRID vGPU-configured VMs**—vSphere HA protects VMs with the NVIDIA GRID vGPU shared pass-through device. In the event of a failure, vSphere HA tries to restart the VMs on another host that has an identical NVIDIA GRID vGPU profile. If no available healthy host meets this criterion, the VM fails to power on.

- **VMware vSAN Enterprise Edition**—Includes all-flash space-efficiency features (deduplication, compression, and erasure coding), software-defined, data-at-rest encryption, and stretched clusters for cost-efficient performance and greater hardware choice.

- **VMware Log Insight**—Provides log management, actionable dashboards, and refined analytics, which enable deep operational visibility and faster troubleshooting.
VMware Horizon

The architecture that this guide describes is based on VMware Horizon 7, which provides a complete end-to-end solution delivering Microsoft Windows virtual desktops to users on a wide variety of endpoint devices. Virtual desktops are dynamically assembled on demand, providing users with pristine, yet personalized, desktops each time they log in.

VMware Horizon 7 provides a complete virtual desktop delivery system by integrating several distributed components with advanced configuration tools that simplify the creation and real-time management of the virtual desktop infrastructure.

The Horizon resources page on the VMware product resources website provides more information. Also see the Horizon License FAQ.

The core Horizon components include:

- **Horizon Connection Server (HCS)**—Installed on servers in the data center. The HCS brokers client connections, authenticates users, entitles users by mapping them to desktops and/or pools, establishes secure connections from clients to desktops, supports single sign-on, sets and applies policies, acts as a DMZ security server for outside corporate firewall connections, and more.

- **Horizon Client**—Installed on endpoints for creating connections to Horizon desktops that can be run from tablets, Windows, Linux, or Mac PCs or laptops, thin clients, and other devices.

- **Horizon Portal**—Provides access to links for downloading full Horizon clients. Enable the HTML access feature to run a Horizon desktop inside a supported browser.

- **Horizon Agent**—Installed on all VMs, physical machines, and Terminal Service servers that are used as a source for Horizon desktops. On VMs, the agent is used to communicate with the Horizon client to provide services such as USB redirection, printer support, and more.

- **Horizon Administrator**—Provides administrator functions such as deployment and management of Horizon desktops and pools, setting and controlling user authentication, and more.

- **vCenter Server**—Provides centralized management and configuration to the entire virtual desktop and host infrastructure. It facilitates configuration, provisioning, and management services. It is installed on a Windows Server host, which can be a VM.

**Horizon clone technology**

VMware Horizon 7 offers the following methods for cloning desktops:

- **Full clones**—Full clones are typically used for testing purposes or to create management VMs. Full clones are not ideal for VDI because full copies have no connection to the original VM. Updates must be performed on each VM with this approach.

- **Linked clones**—Linked clones require less storage resources than full clones. This technology is appropriate for many VDI use cases. Differences between the master VM and the clone are maintained in a delta file. Updates can effectively be rolled
out, although multiple VM rebuilds are required to correctly deploy a patch at the operating system level.

- **Instant clones**—Instant clones are available only with Horizon 7 Enterprise licenses. This technology provisions a VM the instant a user requests one. The result is a far easier approach to operating system updates and patch management, because the VM is created near to the time of login. You can use the combination of JMP features such as App Volumes and User Environment Manager to emulate persistence.

The [VMware Horizon 7 Instant-clone Desktops and RDSH Servers White Paper](http://www.vmware.com/support/pubs/horizon_7_white_paper.html) provides more information.

### Client components

End users can use a variety of client components to access the virtual desktops.

The following table lists the client components that Dell EMC recommends.

</table>
Design sizing and guidelines

This section provides recommendations and guidelines for designing your VDI environment.

Platform configurations

With several options to choose from, consider these basic differences.

- Select the base B5 configuration when designing smaller deployments to meet minimum node requirements. B5 configurations scale well and can also effectively serve the maximum number of VMs for a block.
- C7 configurations are denser configurations that are intended for a higher scale and to reduce the number of nodes to maintain.

Note

In the event of a node outage, the C7 configuration impacts more users.

CPU

User density and graphics considerations:

- Dell EMC Ready Architectures for VDI validation test results suggest that you can use CPU oversubscription to effectively size VDI user density. To use a CPU configuration other than those that have been validated, consider the following guidance to achieve comparable results:
  - **Task workers**—4.25 users per core. For example, 68 task users with dual eight-core processors.
  - **Knowledge workers**—3.75 users per core. For example, 60 knowledge users with dual eight-core processors.
  - **Power workers**—2.75 users per core. For example, 44 power users with dual eight-core processors.
- For graphics configurations consider the following:
  - For high-end graphics configurations with NVIDIA Quadro Virtual Data Center Workstation graphics enabled, consider choosing higher clock speeds over higher core counts. Many applications that benefit from high-end graphics are engineered with single-threaded CPU components. Higher clock speeds benefit users more in these workloads.
  - For NVIDIA Virtual PC configurations, consider higher core counts over faster clock speeds to reduce oversubscription.
  - Most graphics configurations do not experience high CPU oversubscription, because vGPU resources are likely to be the resource constraint in the appliance.

Memory

Best practices for memory allocation and configuration:

- Do not overcommit memory when sizing, because memory is often not the constraining resource. Overcommitting memory increases the possibility of
performance degradation if contention for memory resources occurs (for example, swapping and ballooning of memory). Overcommitted memory can also impact storage performance when swap-files are created.

- Memory must be populated in units of six per CPU to yield highest performance. Dell EMC 14th generation servers using Intel Skylake Processors have six memory channels per CPU, which are controlled by two internal memory controllers, each handling three memory channels. To ensure that your environment has the optimal memory configuration, use a balanced configuration, where each CPU supports a maximum of 12 DIMMs (or 24 DIMMs for a dual-CPU server). The most effective configuration is 12 DIMMs (6 DIMMs per CPU) or 24 DIMMs (12 DIMMs per CPU).

**GPU**

Consider these options when choosing GPU cards:

- Dell EMC strongly recommends NVIDIA M10 graphics options only for Virtual PC workloads. Quadro Virtual Data Center Workstation licenses do support the M10 card, but the card performance is less aligned with the features available in that license.

- For graphically intense workloads like CAD, instead of a single P40 card, it might be more effective to use several P4 cards, which provide more dedicated GPU resources per VM.

  **Note**

  P4 cards are not available in VxRail configurations.

- For workloads performing large computations or running mixed workloads, a P40 card would better meet the needs of the system.

**External vCenter considerations**

The VxRail Manager can upgrade appliances that are contained inside the cluster. Using an external vCenter instance disables the upgrade features available with the VxRail one-click upgrade process, and each appliance requires a separate upgrade.

**Sizing considerations**

This section provides various general best practices for sizing your deployment.

- **User density**—If concurrency is a concern, be sure to calculate how many users will be using the environment at the peak of utilization. For example, if only 80 percent are using the environment at any time, the environment must support only that number of users (plus a failure capacity).

- **Disaster recovery**—When planning for DR, Dell EMC recommends implementing a dual/multi-site solution. The goal is to keep the customer's environment online and, in case of an outage, to perform an environment recovery with minimum disruption to the business.

- **Management and compute clusters**—For our small test environment, we used a combined management and compute cluster. For environments deployed at a larger scale, we recommend that you separate the management and compute layers. When creating a management cluster for a large scale deployment, consider using the E-Series VxRail or the R640 platform to reduce the data center footprint. With a more easily configured platform, the V-Series VxRail or R740XD platforms are preferred for compute clusters.
Network isolation—This design illustrates a two-NIC configuration per appliance with all the traffic separated logically via VLAN. When designing for larger-scale deployments, consider physically separating the management and VDI traffic from the vSAN traffic for traffic isolation and to improve network performance and scalability.

FTT—Dell EMC recommends sizing storage with NumberOfFailuresToTolerate (FTT) set to 1, which means that you must double the amount of total storage to accommodate the mirroring of each VMDK.

Slack space—Dell EMC also recommends adding an additional 30 percent of slack space to prevent automatic rebalancing of storage, which impacts performance. Automatic balancing occurs when the storage reaches 80 percent of the full threshold. Therefore, 70 percent is recommended to reserve a 10 percent buffer.

All-Flash compared with hybrid

- Hybrid and all-flash configurations have similar performance results. Because hybrid uses spinning drives, consider the durability of the disks.
- Only all-flash configurations offer deduplication and compression for vSAN. Dell EMC recommends all-flash configurations for simplified data management.
- All-flash configurations need considerably less storage capacity than hybrid configurations to produce similar FTT, as shown in the following table.

<table>
<thead>

Note

The VMware Workspace ONE and VMware Horizon 7 Enterprise Edition On-premises Reference Architecture provides more details about multi-site design considerations for Horizon.

Test results and density recommendations

Test results provided recommended user densities.

The user densities in the following table were achieved by following the VMware best practices of FTT = 1 and a reserved slack space of 30 percent. All configurations were tested with Microsoft Windows 10 and Microsoft Office 2016.

<table>
<thead>

**Design assessment**

Before deployment, be sure to perform an assessment of your environment to validate design considerations and ensure that you are designing your architecture to meet or exceed the performance of your current environment. Dell EMC Professional Services offers an assessment service for all VDI needs.
Design enhancements

File workload guidance

The increased growth in the amount of data that is stored in file shares and user home directories across corporate IT environments in recent years has resulted in an increased focus on the need to better manage this unstructured data. As a result, many organizations are choosing to deploy dedicated file workload solutions with capabilities such as cloud file tiering and single file system namespaces across their IT infrastructure, including for file workloads in a VDI environment.

Dell EMC provides a number of file workload solutions for different types of file workloads.

Dell EMC Unity

Dell EMC Unity storage is simple, unified all-flash and hybrid storage with hybrid cloud capabilities.

Unity is ideal for general purpose NAS/SAN mixed workload consolidation, smaller file workloads (including small to mid-sized VDI environments), and transactional databases.

The following figure shows an example of a 5,000-user VDI deployment using Unity storage for file shares.

Figure 5 5,000-user pod on Unity

When deploying Dell EMC Unity in a VDI environment, Dell EMC recommends that you deploy a separate Dell EMC Unity storage system with a vSphere HA cluster or Block. This structure provides the greatest scalability, resiliency, and flexibility when deploying and maintaining file services for the overall user pod. As unstructured data storage needs grow over time, the capacity of each Dell EMC Unity storage system can be scaled up independently with minimal user impact. You have the choice to deploy alternative architectures to the one suggested here, but you should carefully consider the tradeoffs.

The Dell EMC Unity All-Flash Unified Storage web page provides guidance about selecting an appropriate Dell EMC Unity storage solution for your file workload requirements.
Dell EMC Isilon file storage

Dell EMC Isilon storage is the industry's number one scale-out NAS solution for any file workload.

Isilon is ideal for a wide range of file workloads (including large-scale enterprise VDI environments requiring a single file system namespace), high performance computing (HPC), archiving, and infrastructure consolidation.

The following figure shows an example of a 20,000-user VDI deployment using Dell EMC Isilon scale-out storage with a single namespace.

**Figure 6 20,000-user pod on Isilon**

When deploying Dell EMC Isilon in a VDI environment, Dell EMC recommends that you deploy a separate Dell EMC Isilon storage system with a vSphere HA cluster or Block. This structure provides the greatest scalability, resiliency, and flexibility when deploying and maintaining file services for the overall user pod. As unstructured data-storage needs grow over time, the capacity of each Dell EMC Isilon storage system can be scaled up independently with minimal user impact. In addition to scaling up each Isilon chassis, Isilon can also be scaled out using the OneFS operating system. This ability means that additional Isilon systems can be added to provide a single volume and namespace that all user pods in a datacenter can access.

As shown in the previous figure, Isilon OneFS can be scaled out in unison with vSAN HA blocks as the VDI environment grows. You can choose to deploy alternative architectures to the one suggested here, but you should carefully consider the tradeoffs.

The **Dell EMC Isilon** web page provides guidance about selecting an appropriate Dell EMC Isilon storage solution for your file workload requirements.
Conclusion

Summary

This design guide has described the integration of vSAN-based appliances from Dell EMC and VMware Horizon 7 brokering software to create virtual application and desktop environments. This architecture provides exceptional scalability and an excellent user experience and empowers IT teams to play a proactive strategic role in the organization.

Dell EMC offers comprehensive, flexible, and efficient VDI solutions that are designed and optimized for the organization's needs. These VDI solutions are easy to plan, deploy, and run.

Dell EMC Ready Architectures for VDI offer several key benefits to clients:

- Predictable costs, performance, and scalability to support a growing workforce
- Rapid deployments
- Rapid scaling, ready to serve enterprises of any size
- Dell EMC support

All the Dell EMC Ready architectures for VDI are configured to produce similar results. You can be sure that whichever vSAN-based appliances you choose has been designed and optimized for your organization's needs.

Next steps

Dell EMC has a configuration to fit the needs of any size organization:

- VxRail E560 or E560F (E Series)—Select this device if graphics are not required or for small deployments where energy concerns exist or space is limited.
- VxRail V570 or V570F (V Series)—This configuration is VDI-optimized and offers the highest processor speeds and graphics capability.
- vSAN Ready Nodes R640—This device is a powerful pre-validated configuration in a dense rack platform. Occupying only 1U in the rack, this powerful server supports A3, B5, or C7 non-graphics configurations for VDI.

To explore more about this solution, its design, and testing, see the Validation Guide for this architecture. Your Dell EMC solutions representative can assist with further information and resources.

The Virtual Desktop Infrastructure page on the Dell EMC website provides additional resources and other VDI designs to help make IT groups a strategic asset.
