Build systems management into your solutions.

Free up resources, increase availability and deploy faster.

When it comes to your intellectual property, the first step is development. But the last step is management. After all, just because it has left your hands doesn't mean your involvement is over. Systems management is incredibly important. In the broadest terms, it increases the simplicity, efficiency and availability of your solutions, which makes them more valuable to you and your customers. Best of all, when you work with Dell EMC OEM Solutions, powerful systems management is integrated into your solution from day one.

At the heart of Dell EMC's systems management is the integrated Dell Remote Access Controller (iDRAC). Automatically included in every solution, it gives you:

Simplified manageability. iDRAC offers a complete set of server management features including configuration, OS deployment, firmware updates, health monitoring and maintenance, which:

- Increases availability
- Improves productivity
- Lowers operating cost
- Enhances security

Agentless monitoring. Dell EMC's agent-free management puts you in control. Once a Dell EMC PowerEdge server powered by Intel processors is connected to power and networking, it offers:

- On-site management
- Remote management
- Time and money savings

Plus, with no need for software agents, you can monitor, manage, update, troubleshoot and remediate Dell EMC servers regardless of operating system or hypervisor presence.

Hassle-free integration. With systems management from Dell EMC OEM Solutions, you can harness our scriptable interfaces and integrate them into your software solutions. That means you aren't spending time and resources developing your own systems management solution.

With Dell EMC OEM Solutions and iDRAC, simplicity, efficiency and availability are built right in. It's the systems management you need, so you can focus on getting your solution to market faster.

For the utmost in IT efficiency, turn to systems management.
