Get the most from your Data Protection Program

BUSINESS CHALLENGES
Optimizing backup operations is increasingly difficult. You are being asked to control costs while new applications are continuously being deployed and data growth is exploding. At the same time, business and compliance requirements seem to be in a constant state of change.

Understanding where to look for gaps can be the biggest hurdle. Once identified, you need a prioritized action plan that will accommodate your business today and in the future.

SERVICE DESCRIPTION
The Dell EMC Blueprint for Backup Architecture Introductory Advisory Service is an interactive workshop that assesses the current state of your data protection program. Dell EMC Experts engage key stakeholders to understand your current data protection program and get a sense for where your business is headed. In addition, they evaluate your data protection processes, business requirements, file and server data, NAS appliance, database, archive, and reporting to get a complete picture of your existing program.

After the workshop is complete, Dell EMC compares your information against data protection best practices and provides a scorecard of your environment. This scorecard becomes the foundation for an action plan to close gaps and improve your data protection capabilities.

SERVICE VALUE
The Dell EMC Blueprint for Backup Architecture Introductory Advisory Service provides you a roadmap to improve your data protection program, reduce complexity and lower operational costs. Our experts provide an independent assessment of your current program so you can transform your data protection environment leveraging the latest technologies and best practices.

Workshops enable customers to:

- Identify backup performance improvement areas
- Eliminate redundant systems and consolidate
- Update out of date processes and technologies
- Develop a roadmap to stay aligned with business growth
